ABOUT ME

Informatics Engineering student at Universitas Budi Luhur who deliberately works **across the lines that usually separate teams** — software engineering, data and analytics, AI and LLM applications, finance and capital markets, and frontline IT support. I build complete systems end to end: collection pipelines, validation layers, statistical and valuation engines, desktop tools, full-stack web platforms, and AI agents — and I have also kept a national newsroom's machines and network running as an IT intern. I build my own route to a solution rather than waiting for one to exist, and I'm comfortable taking on work I've never touched before. I'll say I don't know when I don't know. I'm just not the type to say it twice.

EDUCATION

Universitas Budi Luhur
Aug 2023 – Aug 2027 (Expected)

Bachelor of Informatics Engineering

PROFESSIONAL EXPERIENCE

Media Group (METRO TV)
Mar 2026 – Aug 2026

IT Support Intern

- Handled day-to-day IT support for staff across several divisions, fixing hardware and software problems, swapping out equipment and running routine checks so machines stayed usable.
- Did basic maintenance in the server room, and traced WLAN and cabling faults whenever workstations lost their connection.

PT Tijari Total Solusi
Mar 2026 – Jun 2026

Freelance IT Consultant

- Worked on internal digital systems, from the early concept stage through to building out features.
- Helped put those solutions in place for the business and operations side.

ORGANIZATIONAL EXPERIENCE

Student Association of Informatics Engineering, Universitas Budi Luhur
Aug 2024 – Aug 2025

Education Staff

- Worked with the other divisions to document our programmes, keeping written and video records of what happened.
- Made learning videos and wrote articles for students, and designed the visuals for them in Canva.

PEMATIK — Informatics Engineering Student Week
Mar 2025

Catering & Logistics

- Planned and ran the food for participants and committee across the whole event.
- Dealt with the vendors and timed distribution so meals landed between sessions instead of cutting into them.

SELECTED PROJECTS

ATLAS — AI Travel Concierge
Jun 2026 – Aug 2026

- Built and deployed a booking app with a live database, a payment flow, and search that understands plain sentences.
- Wrote the planning documents behind it as well, covering who it is really for, how the system fits together, the roadmap and what could go wrong.

Rundown Check — Broadcast Schedule Validator

Aug 2026

- Built during the METRO TV internship: a desktop tool that imports a broadcast rundown CSV, auto-detects the column names, and flags overlaps, dead air, overruns, duration mismatches, missing media and not-ready status against a rule engine.
- Scores each rundown 0–100 and lets a new staff member fix rows in place until it reads "ready to air".

Macro Divergence Terminal

Feb 2026 – Present

- Built a self-updating site that rebases IHSG against the regional and global indices actually correlated to it, and flags the days it decouples from the pack.
- Pinned Indonesian news to the trading session it could realistically move, separated market-wide from single-stock news, and mapped news volume by region on a world map. Runs entirely on GitHub Actions — no server to maintain.

Equity Terminal — Fundamental Analysis Tool

Aug 2025 – Sep 2025

- Made a browser tool that takes pasted financial data and works it into a full investment thesis, including profitability, valuation, credit risk and scenarios.
- Decided it should measure a company against its own history instead of using one fixed benchmark for everything.

TBAGSBOOK — Digital Reading Platform

Mar 2025 – Jun 2025

- Built and launched a reading platform on Node.js, Express and PostgreSQL, with books, comics, a personal library, comments and a points system.
- Did the whole login side myself. Google sign-in, two-factor that can't be skipped, sessions I can revoke from the server, and rate limiting to stop people brute-forcing it.

Live Order Flow Terminal

Nov 2024 – Present

- Built a desktop app that scrapes live running trade for 500+ stocks in the background and renders a buy/sell footprint per price level.
- Guaranteed every stock is recorded regardless of what's on screen, backed by 193 automated tests, so a stock outside today's watchlist can still be studied tomorrow.

Market Research Terminal & Quantitative Data Engine

Feb 2024 – Present

- Built a research setup for the Indonesian market in Python. It covers the data pipeline, a validation library, and desktop apps for looking at price and broker activity.
- Tested whether the patterns actually hold up rather than assuming, kept future data out of past decisions, and ran backtests with real trading costs included.

HARD SKILLS

Software Engineering — Advanced Python; TypeScript & JavaScript; React & Next.js; Node.js & Express; desktop applications (PyQt6, Tkinter); REST & API design; authentication & session security (OAuth 2.0, TOTP 2FA); automated testing; Git & CI/CD (GitHub Actions); software architecture & documentation.

Data & Analytics — ETL pipeline design; web scraping & browser automation (Selenium); data validation & quality scoring; data-leakage prevention & point-in-time testing; PostgreSQL & schema design; regression, correlation & lead-lag analysis; multiple-comparison correction; event-study & anomaly detection; backtesting with realistic costs; dashboards & geospatial visualisation.

AI & LLM — LLM integration (Gemini); AI agents, function calling & tool use; prompt engineering; rule-based NLP (text classification, entity extraction); AI cost modelling & guardrails. Gemini Certified Student.

Capital Market & Valuation — equity valuation & financial modelling (DCF, Reverse DCF, WACC/CAPM); ROIC vs cost of capital; DuPont decomposition; earnings-quality & accrual analysis; credit-risk scoring; scenario modelling; order flow & broker-summary analysis; foreign/institutional/local fund flow; price-level footprint; sector rotation & seasonality; tick size & auto-rejection bands.

IT Support & Infrastructure — end-user support across divisions; hardware troubleshooting & equipment replacement; preventive maintenance; server-room operations basics; LAN/WLAN & cabling fault tracing.

Business, Product & Design — requirements gathering & business-process analysis; rule-engine / validation-workflow design; product discovery & PRD writing; roadmapping & edge-case / QA matrices; UI/UX & responsive web design (Tailwind CSS); visual design in Canva; learning-video production & article writing; technical writing.

Tools — Git & GitHub Actions, Selenium, AI-assisted development, Tailwind CSS, Plotly & Matplotlib, Canva, Microsoft Office & Google Workspace.

SOFT SKILLS

Analytical Thinking, Problem Solving, Detail Oriented, Root-Cause Analysis, Evidence-Based Decision Making, Technical Writing, Cross-Functional Collaboration, and Adaptability.

LANGUAGES

Indonesian — Native **English** — Advanced
