ABOUT ME

Computer Science student at Universitas Budi Luhur with a strong interest in data and capital markets, especially market data analysis, data quality engineering, and full-stack development. Experienced in building systems end to end, from data pipelines and validation layers to statistical engines and web applications, through independent projects and IT internships in media and technology consulting. I'm the type of person who builds my own route to a solution rather than waiting for one to exist, and confident taking on work I've never touched before. I'll say I don't know when I don't know. I'm just not the type to say it twice.

EDUCATION

Universitas Budi Luhur
Aug 2023 – Aug 2027 (Expected)

Bachelor of Informatics Engineering

PROFESSIONAL EXPERIENCE

Media Group (METRO TV)
Mar 2026 – Aug 2026

IT Support Intern

- Handled day-to-day IT support for staff across several divisions, fixing hardware and software problems, swapping out equipment and running routine checks so machines stayed usable.
- Did basic maintenance in the server room, and traced WLAN and cabling faults whenever workstations lost their connection.

PT Tijari Total Solusi
Mar 2026 – Jun 2026

Freelance IT Consultant

- Worked on internal digital systems, from the early concept stage through to building out features.
- Helped put those solutions in place for the business and operations side.

ORGANIZATIONAL EXPERIENCE

Student Association of Informatics Engineering, Universitas Budi Luhur
Aug 2024 – Aug 2025

Education Staff

- Worked with the other divisions to document our programmes, keeping written and video records of what happened.
- Made learning videos and wrote articles for students, and designed the visuals for them in Canva.

PEMATIK — Informatics Engineering Student Week
Mar 2025

Catering & Logistics

- Planned and ran the food for participants and committee across the whole event.
- Dealt with the vendors and timed distribution so meals landed between sessions instead of cutting into them.

SELECTED PROJECTS

ATLAS — AI Travel Concierge
Jun 2026 – Aug 2026

- Built and deployed a booking app with a live database, a payment flow, and search that understands plain sentences.
- Wrote the planning documents behind it as well, covering who it is really for, how the system fits together, the roadmap and what could go wrong.

Macro Divergence Terminal
Feb 2026 – Present

- Built a self-updating site that rebases IHSG against the regional and global indices actually correlated to it, and flags the days it decouples from the pack.
- Pinned Indonesian news to the trading session it could realistically move, separated market-wide from single-stock news, and mapped news volume by region on a world map. Runs entirely on GitHub Actions — no server to maintain.

Equity Terminal — Fundamental Analysis Tool

Aug 2025 – Sep 2025

- Made a browser tool that takes pasted financial data and works it into a full investment thesis, including profitability, valuation, credit risk and scenarios.
- Decided it should measure a company against its own history instead of using one fixed benchmark for everything.

TBAGSBOOK — Digital Reading Platform

Mar 2025 – Jun 2025

- Built and launched a reading platform on Node.js, Express and PostgreSQL, with books, comics, a personal library, comments and a points system.
- Did the whole login side myself. Google sign-in, two-factor that can't be skipped, sessions I can revoke from the server, and rate limiting to stop people brute-forcing it.

Live Order Flow Terminal

Nov 2024 – Present

- Built a desktop app that scrapes live running trade for 500+ stocks in the background and renders a buy/sell footprint per price level.
- Guaranteed every stock is recorded regardless of what's on screen, backed by 193 automated tests, so a stock outside today's watchlist can still be studied tomorrow.

Market Research Terminal & Quantitative Data Engine

Feb 2024 – Present

- Built a research setup for the Indonesian market in Python. It covers the data pipeline, a validation library, and desktop apps for looking at price and broker activity.
- Tested whether the patterns actually hold up rather than assuming, kept future data out of past decisions, and ran backtests with real trading costs included.

HARD SKILLS

Advanced Python, TypeScript, JavaScript, React, Next.js, Node.js, SQL & PostgreSQL, Git & CI/CD, Selenium, AI-Assisted Development, Microsoft Office, ETL Pipeline Design, Data Validation & Quality Scoring, Data Leakage Prevention, Web Scraping & Automation, Automated Testing, Performance Optimisation, Database Design, Statistical Analysis, Regression Analysis, Multiple-Comparison Correction, Event-Study & Anomaly Detection, Backtesting, Out-of-Sample Validation, Equity Valuation, Reverse DCF, ROIC Analysis, Order Flow & Broker Summary Analysis, Price Footprint, Market Microstructure, Sector Rotation & Seasonality Analysis, Rule-Based Text Classification & Entity Extraction, Geospatial Data Visualisation, API Integration, UI/UX Design.

SOFT SKILLS

Analytical Thinking, Problem Solving, Detail Oriented, Root-Cause Analysis, Evidence-Based Decision Making, Technical Writing, Team Collaboration, and Adaptability.

LANGUAGES

Indonesian — Native **English** — Advanced
